

Factoring Polynomials

In This Unit:

1. GCF's (Greatest Common Factor)
2. $x^2 + bx + c$
3. $ax^2 + bx + c$
4. Special Product Patterns

Bellwork
3/20/12

Divide the polynomials.

1.
$$\frac{-12x^4 + 9x^2 - 27x}{-3x}$$

$$\frac{-12x^4}{-3x^1} + \frac{9x^2}{-3x^1} + \frac{-27x^1}{-3x^1}$$

$$4x^3 - 3x^1 + 9$$

Lesson 12.1 GCF's

What You Need to Know:

A greatest common factor is the product of all the common factors.

To find the GCF of a polynomial, find what each term has in common.

The GCF of $7x^3-63x$ is $7x$.

If the first term of the polynomial (in standard form) is negative, the GCF should be negative because we never want a polynomial that starts with a negative. Boo!

Once you find the GCF, write it outside of the simplified polynomial...like *reverse distribution*.

$7x^3-63x$ simplified is $7x(x^2-9)$

GCF's

Write the polynomial in simplest form by finding the GCF.

$$3w^3 - 75w$$

$$24y^3 + 32y$$

$$3a^2 + 30$$

$$-7t^5 - 14t^4 + 7t^3$$

$$2x^3 + 12x^2 + 18x$$

Homework Assignment

Worksheet "GCF's"

Bellwork
03/21/12

Write the polynomial in simplest form by finding the GCF.

1. $-8k^4 + 16k^3 - 64k^2$

Lesson 12.2

x^2+bx+c

What You Need to Know:

Tips for Signs:

| | |
|------------|--|
| x^2+bx+c | $(\ + \) (\ + \)$ |
| x^2-bx+c | $(\ - \) (\ - \)$ |
| x^2+bx-c | $(\ - \) (\ + \)$ or $(\ + \) (\ - \)$ |
| x^2-bx-c | $(\ - \) (\ + \)$ or $(\ + \) (\ - \)$ |

In Order to Factor:

1. Standard Form?
2. Reduced (Distributive)?
3. Write as a product (Reverse Foil)!

How to Factor x^2+bx+c :

1. Factor the first term.
2. Factor the last term.
3. Find factors of the last term that add (or subtract) to give middle term.

$$x^2 + bx + c$$

Factor the trinomial.

$$x^2 + 5x + 6$$

$$x^2 + 6x + 5$$

$$x^2 - 7x + 12$$

$$x^2 - 4x - 12$$

$$x^2 + 3x - 28$$

$$x^2 + 15x + 56$$

Homework Assignment

Worksheet "Factoring x^2+bx+c "

Bellwork
03/26/12

Factor the polynomial.

1. $4x^4 + 36x^3 + 32x^2$

Lesson 12.3

ax^2+bx+c

What You Need to Know:

How to Factor ax^2+bx+c :

1. Factor the first term.
2. Factor the last term.
3. Find a combination of the factors of the 1st and last term that multiply and + (or -) to give the middle term.

It's trial and error! When in doubt, try any of the factors!

If the order you choose doesn't work, try this:

1. Switch the signs
2. Switch the order of the numbers
3. Try a different set of factors

$$ax^2+bx+c$$

Factor the trinomial.

$$5x^2+11x+2$$

$$2x^2+5x+3$$

$$9x^2+65x+14$$

$$6x^2-23x+15$$

$$8x^2+38x+9$$

Homework Assignment

Worksheet "Factoring ax^2+bx+c "

Bellwork
03/28/12

Write the polynomial in simplest form by finding the GCF.

1. $-8k^4 + 16k^3 - 64k^2$

Bellwork 03/28/12

Factor.

1. $3x^2$ - $23x$ + 8

$$\frac{3}{1} \mid 3 \quad (3x + 1)(1x - 8)$$

$$\begin{array}{r} 8 \\ 1 \overline{) 8} \\ \underline{2} \\ 4 \end{array}$$

$$+1x + -24x = -23x \checkmark$$

Lesson 12.4 Special Product Patterns

What You Need to Know:

Difference of Two Squares Pattern:

$$a^2 - b^2 = (a + b)(a - b)$$

Perfect Square Trinomial Pattern:

$$a^2 + 2ab + b^2 = (a + b)^2$$

$$a^2 - 2ab + b^2 = (a - b)^2$$

You still need to simplify, if possible!

$$x \cdot x = x^2$$

Special Product Patterns

Factor the expression. Simplify first, if necessary!

$$\sqrt{m^2 - 9}$$

$$(m + 3)(m - 3)$$

$$\sqrt{49q^2 - 81}$$

$$(7q + 9)(7q - 9)$$

$$\frac{2x^2 + 6x}{2x}$$

$$12 - 27x^2$$

$$-\frac{27x^2}{-3} + \frac{12}{-3}$$

$$-3(9x^2 - 4)$$

$$-3(3x + 2)(3x - 2)$$

$$x^2 - 8x + 16$$

$$(x - 4)^2$$

$$-4x \cdot 2 = -8x$$

$$\sqrt{9y^2 + 60y + 100}$$

$$(3y + 10)^2$$

$$\frac{2x^2 - 12x + 18}{2}$$

$$\frac{2x^2}{2} + \frac{-12x}{2} + \frac{18}{2}$$

$$2(\sqrt{x^2 - 6x + 9})$$

$$2(x - 3)^2$$
